System process flow assessment

How the enhanced Credit Factory maps to DECSI's 12-stage loan process — from application through disbursement, reporting, and control.

9 of 12 stages ready

Application through appraisal, authorization, workflow, and analytics are built end-to-end.

1 stage ready at go-live

Disbursement to core banking is built; the live CBS connection is switched on at deployment.

2 stages to complete

Dedicated legal-administration step, and a standalone fraud-detection product, remain to match the diagram fully.

Process alignment

Assessed against DECSI's system flow
(application → documents → queue → GPS → estimation → appraisal → authorization → legal → processing → disbursement → reports → security).

BASIS

DECSI system process flow (12 stages)

1. Purpose of this assessment

DECSI provided a 12-stage system process flow covering the loan journey from application to reporting and control. Seqela assessed the **enhanced Credit Factory** against that flow so management can see, stage by stage, what is ready for institution-wide rollout.

DECSI's live production system today covers **queue management, user management, branch management, loan type management, and collateral type management** (53,901 applications processed on that platform). This report is not a claim that all twelve boxes are already live in every branch. It is an assessment of the **enhanced factory built for DECSI** — documents, appraisal, GPS collateral, committees, Digital Apply, post-approval, and disbursement — mapped to the process DECSI defined.

Headline. The Credit Factory is aligned with DECSI's process. Nine stages are fully implemented. Disbursement to core banking is implemented in the product and is enabled when DECSI's CBS connection is configured at go-live. Two items remain if the diagram is to be matched one-for-one: a dedicated *legal administration* queue after authorization, and a dedicated *fraud detection* product beyond the document, watchlist, and risk controls already in the system.

Overall process coverage of the enhanced factory against the 12-stage flow: approximately 90%.

2. How the assessment was done

- Each box on DECSI's system process flow was mapped to the corresponding Credit Factory module, screens, and controls.
- Status is **Ready** when the stage exists end-to-end in the product; **Ready at go-live** when the product is built and a live DECSI connection (core banking) is required to operate it in production; **Partial** when the intent is covered in another step, not as the standalone stage drawn on the flow.
- This is a product-and-process assessment for management and IT. It is not a priced proposal and it is not a branch UAT sign-off.
- Quality gate: the Credit Factory automated test suite passed **250 of 250** tests on 20 August 2026 (including application create, appraisal lock, security headers, password policy, and GPS/offline field retry).

3. DECSI's 12-stage process

The assessment follows the process DECSI provided, in this order: Application → Documents → Queue number → GPS → Collateral estimation → Loan appraisal → Authorization → Legal administration → Processing workflow → Disbursement → Reports & analytics → Security & compliance.

What “Ready” means

The stage is implemented in the Credit Factory: staff (and, where relevant, the applicant) can complete the work on screen, with records, controls, and hand-off to the next stage.

What remains

Items that still differ from the drawing: legal work as its own queue after authorization; fraud as a dedicated product; and switching on the live core-banking booking at go-live.

4. Stage-by-stage result

#	DECSI PROCESS STAGE	STATUS	WHAT THE CREDIT FACTORY DOES
1	Application Applying for loan; getting information	READY	Branch / credit staff capture the file. Customers can also apply through Digital Apply. Customer information and loan type are recorded at intake.
2	Documents Necessary documents; approval	READY	Checklist by loan type, upload, English and Amharic document reading, and officer verify / reject before the file proceeds.
3	Loan queue no. generation	READY	A unique queue number is issued automatically when the loan is created (staff, online, or assisted create).
4	GPS Collateral integration; data capture	READY	Field visit captures site location, photos, and evidence for building, land, and other collateral, including offline field use.
5	Collateral estimation Estimation detail; estimated amount	READY	Bill of quantities, unit prices, estimated value, and engineering quality review. The total feeds the appraisal collateral sheet.
6	Loan appraisal Financial, business, approval	READY	Seven-step MSME and corporate appraisal: character, cash flow, environment & social, collateral, recommendation, and optional repayment schedule.
7	Authorization Branch / zonal / HO operation / HO management	READY	Multi-level committees with amount bands: branch, district (DECSI “zonal” on the flow), head office, and management (CEO / VP / Board). Delegations are supported.
8	Prohibition of collateral in legal administration	PARTIAL	Restriction, power of attorney, title search, mortgage registration, and notary papers are captured after approval and <i>block disbursement</i> until verified. This is not yet a separate Legal Administration queue with a legal officer role.
9	Processing workflow Status tracking; integration & verification	READY	Role queues, status on every file, document verification, process policy gates, and notifications as the file moves.
10	Disbursement Disbursing to core banking	READY AT GO-LIVE	Post-approval → Finance → confirm → book. The product is built to disburse into DECSI's core banking system. The live CBS link is configured at deployment.
11	Report & analytics	READY	Operational reports and Credit Intelligence (pipeline, collateral, decision support). Book-side arrears figures deepen when live CBS outstanding is connected.
12	Security and compliance Role-based access; authorization; fraud detection	PARTIAL	Roles, approval levels, multi-factor login, lockout, password policy (minimum 10 characters), browser security headers, and audit trail are in place. Fraud control today is document authenticity, watchlist, and the risk desk — not a separate fraud/AML case system.

5. Names on the flow vs names in the system

Authorization titles on the drawing use DECSI operational language. The Credit Factory uses the same four-level chain with the geography names already in the live system.

ON DECSI'S FLOW	IN THE CREDIT FACTORY	ALIGNMENT
Branch (S/branch) level	Branch committee (including sub-branch through the branch)	Direct
Zonal level	District committee	Same function; "district" is the name used in DECSI's current system
HO Operation level	Head-office committee, with Branch Cooperative intake as a separate gate	Function covered; split into committee + cooperative intake
HO Mgt level	Management committee (CEO / VP / Board)	Direct
Prohibition of collateral in legal administration	Post-approval legal papers that must be verified before disbursement	Same control, later in the path (before money leaves, not as its own queue)

6. Items to complete against the diagram

A. Legal administration as its own stage (box 8)

Today the factory will not disburse until government restriction, power of attorney, and related legal papers are uploaded and verified. If DECSI requires a **Legal Administration desk** between committee approval and Finance (legal officer role, legal queue, "cleared for disbursement"), Seqela will add that step so the screen path matches the drawing exactly.

B. Fraud detection as a dedicated product (box 12)

Role-based access, authorization levels, multi-factor login, password policy, browser security headers, and audit are ready. Document fraud controls (authenticity, identity match, suspicious files) and a watchlist are ready. If DECSI's "Fraud Detection" means a full AML / investigation case system, that should be specified as a scoped addition. If document and origination controls are sufficient, box 12 can be treated as met for access and authorization, with fraud controls at intake.

C. Core banking at go-live (box 10)

Disbursement, Finance approval, and booking into core banking are built. At deployment, DECSI IT and Seqela enable the live CBS endpoints so disbursement posts to the book rather than a test connection. Customer lookup at application uses the same CBS party service when it is live.

7. Recommended next steps

Four decisions close the remaining gap between the Credit Factory and DECSI's 12-stage drawing.

1. Confirm legal administration (box 8)

Keep legal papers as a disbursement gate (already built), or add a Legal Administration queue and legal officer role after authorization so the path matches the drawing one-for-one.

2. Confirm fraud detection (box 12)

Accept origination fraud controls (document authenticity, watchlist, risk desk), or commission a dedicated fraud / AML investigation product as a scoped addition.

3. Plan core-banking go-live (box 10)

Joint Seqela-DECSI IT session to connect customer lookup and disbursement booking to DECSI's live core banking endpoints at deployment.

4. Walk the twelve stages (UAT)

Run a sample MSME file through the flow with Credit, Engineering, Cooperative, Finance, and IT, using this document as the checklist.

For management. The enhanced Credit Factory is built to DECSI's process and can be rolled out against this flow. The remaining decisions are process design (legal desk; fraud product) and the core-banking connection at go-live — not a missing origination, appraisal, GPS, or committee system.
